## ABSTRACT

In this paper, we present a quest structure, in the form of a grammar, obtained from an analysis of the main quests of a single player role playing game (RPG), namely *“The Witcher 3 - The Wild Hunt”*. This grammar extends a previously presented analysis by other authors on MMORPG quests. This extended grammar is suitable for application in single player RPGs. The grammar allows the procedural generation of quests in any RPG wanting more intricate quests. We believe that this extension makes the previous grammar more expressive. And it will bring us closer to being able to represent and procedurally generate quests that are equal to human authored ones.

## Author Keywords

Procedural generation; interactive storytelling; RPG; quests; story; NPC; player.

## INTRODUCTION

Computer Role Playing Games (CRPGs), commonly referred to as Role Playing Games (RPGs) are a video game genre where a player embodies a story world character (and/or several, commonly referred to as party) and has to overcome a series of linked challenges, ultimately achieving some overarching goal or the conclusion of a central storyline. Furthermore, the player is allowed to develop his/her character(s) through consequential decisions. RPG's are known for being content-heavy games, possessing vast worlds with various non-playable characters (NPCs), as well as intricate storylines and side-quests [10]. The process of this content creation takes a considerable amount of time and money [12]. It's consumption though is much faster, and after a player completes every main quest and side-quest, the game's replay value drops off considerably.

As a consequence, RPGs are perfect candidates for the application of Procedural Content Generation (PCG), which is

the use of computer algorithms for creating content that meets a set of evaluation criteria [10][16]. This becomes quite useful, when trying to produce content for the game industry, that is becoming more demanding [11]. According to Hartsook[10] there are two broad uses of PCG in games: content creation and adaptation of gameplay. By automatically generating content, it could offload the task of content creation, reducing the amount of work done by humans, making the development costs cheaper. Also, by learning players' information that can't be known during design-time, such as their preferences, desires and abilities, one could personalize the story and world of the game. And thus, maximizing pleasure and minimizing frustration and boredom[10].

PCG has become quite popular in recent years, currently being used in a variety of different subfields. Examples of generated content include: dungeons and maps (Binding of Isaac: Rebirth[13], Diablo series[6]); enemies (Left 4 Dead[17]), animation of character behaviour (Spore[1]), weapons (Borderlands 2[9]) and even whole universes (No Man's Sky[8]). Another area where PCG could be used is in generating interactive stories (examples given in the next section). A system based on interactive storytelling must be capable of generating interactive narratives in a coherent and believable fashion. This means that the sequence of events that constitute the overarching story must be causally and temporally coherent and characters that partake in these events must act in a believable manner[3][14]. In storytelling systems, characters are perceived as being believable when the actions they execute are motivated by their desires and intentions and these are consistent with the knowledge they possess about the current story world.

In the context of RPGs, the sequence of events that constitute the overarching story, can also be called quests. Quests are tasks given by NPCs to a player in the form of requests, that require the player to complete goals often in return for some reward. If quests are seen as the mere movement from one location to another in order to complete a goal, which involves character actions and dialogue, one can see that a sequence of this quests could shape a story. In games, story is the progression of the player through space[2][10]. The set of quests that are necessary to complete the game form up the main story. Additional side-quests are often offered to

the player to extend the gameplay[12]. Having a system that procedurally generates these quests can potentially increase the variability and replayability of games.

This paper will focus solely on quest structure, and presents the results obtained from our structural analysis of the main story quests from "The Witcher 3 - The Wild Hunt", an acclaimed single player RPG game. This analysis departs from and further extends the work done by Doran and Parberry [4] in their structural analysis of several MMORPG quests. We consider a quest's structure to be all actions performed by the player, since the moment the quest is given to him/her, until the quest's goal is achieved. Using this structure, we can procedurally generate a variety of intricate quests and apply them in a RPG game. The remainder of this paper is divided into four sections: 1. review of several approaches; 2. presentation of the results of the structural analysis of the main quests from "The Witcher 3 - The Wild Hunt" (Witcher); 3. an example of a quest from Witcher, based on the results obtained; 4. conclusions and future work.

## RELATED WORK

To solve the problem of plotline adaptation, Li and Riedl[12] present an offline algorithm that, given a main plotline, consisting of a sequence of quests, a library of quests, and a set of player requirements, produces "a sound, coherent variation" of the original plotline. Preserving the human authors' intent, while meeting player requirements. The complete plotline is represented by a partially ordered, hierarchical plan composed of events that will unfold in a virtual world. These events can be within and outside quests, and are represented by actions performed by the player, non-player characters, or even by natural occurrences in the virtual world. Events possess preconditions, that must be satisfied, and effects, that become true. Causal relationship between two events is established through causal links via some condition that needs to be satisfied. They allow abstraction hierarchies, through decomposition of abstract events into less abstract ones.

In their approach quests are represented as "top-level" abstractions. Quests have only one effect, the acknowledgement of its completion, and it may or may not have preconditions. Quests are then decomposed into two abstract events: a task and a reward, which are further decomposed into basic actions. A quest that requires the player to hunt down a witch, can be decomposed in the following way: the player would first have to get a water bucket to pour on the witch, ultimately killing her (the task event), in order to acquire the trust of the king (the reward event). In between, events like the witch dropping her shoes, the player picking them up and showing them to the king as proof of the achievement, would complete the plotline. Narrative soundness and coherence, are then guaranteed, through the satisfaction of all preconditions of an event, and through the causal links connecting each event, thus creating a path that leads to a significant outcome.

The game plot adaptation algorithm takes the partial-order plan described, as well as the set of player preferences. The search is conducted by adding and removing events until success criteria are met. Once complete, the resulting story structure is converted and sent to GAME FORGE system[10] to

render a world that supports the story and executes the game. Indeed, although Li and Riedl[12] are capable of producing quests with a certain amount of control, based on players' requirements, they are still dependent on human authoring for the sequence of quests that constitute the plotline. Furthermore, the quests are customized and generated at the start of the game, as opposed to being generated while the player is in play.

Doran and Parberry [4][5] did a structural analysis of almost 3000 human-authored quests from several Massive Multi-player Online Role Playing Games (MMORPG). The analysis showed a common structure shared by human-authored quests, "changing only details such as settings, but preserving the relationship between actions". They observed structural patterns in quests, which occurred in predictable situations, each with its own implicit preconditions and effects.

They first observed that quests can be categorized into 9 distinct NPC motivations: Knowledge, Comfort, Reputation, Serenity, Protection, Conquest, Wealth, Ability and Equipment. They believe the use of motivations to be essential for ensuring intentionality in the generation and giving of quests. Quests are thus intended to represent a NPC's prime concern. Each of these motivations contains 2-7 motivation-specific strategies. In turn, each of these strategies is composed of a sequence of 1-6 actions, that the player must perform. Each action is further defined as either an atomic action performed by the player, or a recursive sequence of other actions or action variants[4]. The quest structure is represented in the form of a grammar, in which terminal symbols are atomic actions and non-terminal symbols are action rules, that extend to further actions or action rules. The sequence of actions, that the player is required to perform in order to complete the quest, can be viewed as the leaves in a tree, with the root representing the entire quest [4]. Actions can also be replaced by sub-quests, that use the same structure.

With this structure, made from the extracted rules and commonalities of the analysed quests, they are able to demonstrate a prototype system that procedurally generates quests, which in their view are appropriate for use in RPGs. The generator starts with an NPC motivation, from it the generator consults the list of specific strategies, selects one and creates a quest that addresses the motivation. The generator was written in Prolog, due to its "ability to backtrack and try alternative solutions"[4].

As a rough generalization, single player RPGs tend to focus more on the journey(story), which plays a central role in these type of games. At the end the player either explores the open world or simply restarts the game in a new save file. As a contrast, in MMORPGs this journey feels more like a grind that the player wants to complete as quickly as possible, in order to get to the endgame content, where the true game begins. Quests generated using the structure previously described, which was used by Doran and Parberry on their prototype generator [4], are solely based on MMORPGs.

So as stated before, according to Doran and Parberry's structural analysis, human authored quests have a shared structure.

Having this in mind, we tried to analyse quests from single player RPGs, which tend to have a strong focus on the story component of the game, using the rules defined by Doran and Parberry [4]. We chose “*The Witcher 3 - The Wild Hunt*”, since it was received with critical acclaim and was a financial success, having also won several awards for Game of the Year from multiple publications. For the purpose of this paper, only the main story quests were analysed, which are in a total of 58, since side-quests are more similar to MMORPG quests.

## STRUCTURAL ANALYSIS

For the structural analysis, 58 main story quests from “*The Witcher 3 - The Wild Hunt*” (Witcher) were examined, in order to determine whether they also shared the structure extracted by Doran and Parberry from their own analysis. Quest descriptions were obtained from sites like “*The Witcher Official Wikia*” [20], VG24/7 [18], and from watched walkthroughs from several Youtube channels like TheRealCheatCC [15], GameRiot [7] and VGFAQ [19]. Quest descriptions consisted of the sequence of actions the player had to perform, NPC dialogue and causal and temporal relationships between the different quests.

Using the descriptions from “spoiler” sites and the resulting quest structure from the analysis described by Doran and Parberry [4], we undertook an attempt to represent Witcher quests. Alas, representing these main quests proved to be more difficult than expected. Indeed, the NPCs that gave out the quests, shared the same or similar motivations previously described, but since the action rules Doran and Parberry defined had some limitations, it was impossible to fully describe Witcher quests. In order to come up with the necessary changes to counter these limitations (both described in the upcoming paragraphs), each quest was analysed in the following way: first it was necessary to record every player action in the respective quest; second a tree was built for each quest, in the manner described in the related work section, using the rules defined by Doran and Parberry [4], while adding the changes required to represent each quest; third, the changes made were extracted and added to the new set of rules, the results of which can be seen in Tables 1, 2 and 3. Changes made are highlighted in bold. The sequence of actions and rules are written in Backus Normal Form, a notation technique for grammars, same as in [4].

When comparing with [4], the first change worthy of noting, regards the last action of a quest’s strategy, specifically “give” and “report” actions. During our analysis, we observed that some Witcher quests required the player to give or report something, as a last step before completing a quest. But some strategies defined in [4] don’t allow this. The opposite also happened, where strategies defined in [4], have a last action give/report, but in the game the player isn’t required to do any of those. To give a few examples: in the short main story quest “Disturbance”, the player has to explore the castle, to find and remove an object (“repair”), that is messing with one of Yennefer’s spells. After its removal the player is required to report back to Yennefer. This sequence isn’t fully represented in [4], because it is missing the report action. A second example would be the main story quest “The

Sunstone”, which requires the player to find and gather the lost item Sunstone. Using Doran and Parberry’s structure, the player would be obliged to give the Sunstone after it was gathered. However, this quest finishes as soon as the Sunstone is acquired. This was a recurrent problem, so to counter this obstacle, we decided to put in almost every strategy, one of two action rules, namely a <give> or a <report>. This way, it is now possible to decide during generation, whether a quest’s final action should require the player to either report a quest’s completion, give an item back, or neither.

The second change resides in the <goto> set of rules (see Table 2). According to Doran and Parberry’s rules, it wasn’t possible to be given a sub-quest without having to learn something (see Table 2, rule 9 and rules 12-14), which is something that happened often in The Witcher 3. So it was necessary to add a <prepare> rule, that offered this possibility (see Table 2, rules 10 and 16). Also the rule that required learning (rule 10 from Table 2) no longer has a mandatory “goto” action. Which limited the order in which certain events could occur. Now, the new <goto> action rule can be expanded to offer more possibilities to the quest. It was also added the action rule <rescue> (see Table 2, rules 33-36), in order to allow the player to simply free a character, and not having to escort it every single time. The action rule <defeat> (see Table 2, rules 27 and 28) was added, so it could be possible to decide during generation whether a strategy would require the player to either kill or merely damage an enemy. Before strategies had one of these actions imposed, which conflicted with the representation of some of the Witcher quests, that had one of those strategies. In some Witcher quests, where it was only required for the player to damage someone or something, the rules defined by Doran and Parberry would instead have the player kill someone or something, and vice-versa. An example of this is the quest “Bald Mountain”. After the death of their mentor Vesemir, Geralt (the player) and Ciri bloody for vengeance, track down Vesemir’s killer Imlerith and ultimately kill him. Using Doran and Parberry’s set, it wouldn’t be possible to represent this. In their set, the strategy “Revenge, Justice” from the “Serenity” motivation has a mandatory “damage” atomic action, while what we seek is a “kill” atomic action.

Finally, for the actions (see Table 3), we added four new atomic actions that can be performed by the player. During the analysis we encountered some actions that were not represented in their set of actions. The most significant ones being “examine” and “follow”. Doran and Parberry’s rules only considered learning either through listening to a character, after doing a sub-quest for said character, or by reading a book. After analysing Witcher quests it was clear that one can also learn by examining clues or objects. One example is the quest “Novigrad Dreaming”, where a ghost leaves drawings that, after being examined, show the player what he/she has to do next. The action “follow” also appears a lot, practically in every quest. While following a character, the player has

<b>Motivation</b>	<b>Strategy</b>	<b>Sequence of Actions</b>
Knowledge	Deliver item for study Spy Interview NPC Use item on field	<get> <give> <goto> spy <report> <goto> listen <report> <get> <goto> use <give>
Comfort	Obtain luxuries Kill pests	<get> <give> <goto> <defeat> <report>
Reputation	Obtain rare items Kill enemies Visit dangerous place	<get> <give> <goto> <defeat> <report> <goto> <report>
Serenity	Revenge, Justice Capture Criminal Check on NPC (1) Check on NPC (2) Recover lost/stolen item Rescue NPC	<goto> <defeat> <report> <goto> <capture> <report> <goto> listen <report> <goto> take <give> <get> <give> <goto> <rescue> <report>
Protection	Attack threatening entities Capture Criminal Treat or Repair (1) Treat or Repair (2) Create Diversion (1) Create Diversion (2) Assemble fortification Guard entity Recruit	<goto> <defeat> <report> <goto> <capture> <report> <get> <goto> use <report> <goto> repair <report> <get> <goto> use <report> <goto> damage <report> <goto> repair <report> <goto> defend <report> <goto> listen <report>
Conquest	Attack enemy Steal stuff Recruit	<goto> <defeat> <report> <goto> <steal> <give> <goto> listen <report>
Wealth	Gather raw materials Steal valuables for resale Make valuables for resale	<goto> <get> <report> <goto> <steal> <give> <goto> repair <give>
Ability	Assemble tool for new skill Obtain training materials Use existing tools Practice combat Practice skill Research skill (1) Research skill (2)	<goto> repair use <get> use <goto> use <goto> damage <goto> use <get> use <report> <get> experiment <report>
Equipment	Assemble Deliver supplies Steal supplies Trade for supplies	<goto> repair <give> <get> <give> <steal> <give> <goto> exchange

**Table 1. Strategies for each NPC's motivation.**

#	Rules	Explanation
0.	<b>&lt;Quest&gt; ::= &lt;Knowledge&gt;   &lt;Comfort&gt;   &lt;Reputation&gt;   &lt;Serenity&gt;   &lt;Protection&gt;   &lt;Conquest&gt;   &lt;Wealth&gt;   &lt;Ability&gt;   &lt;Equipment&gt;</b>	This is the root of a quest, which expands into one of the 9 motivations. Which will eventually be expanded into one of the strategies, specific to said motivation.
1.	<b>&lt;subquest&gt; ::= &lt;goto&gt;</b>	Go someplace.
2.	<b>&lt;subquest&gt; ::= &lt;goto&gt; &lt;QUEST&gt; &lt;goto&gt;</b>	Go perform a quest and return.
3.	<b>&lt;goto&gt; ::= <math>\epsilon</math></b>	You are already there.
4.	<b>&lt;goto&gt; ::= goto</b>	Go to a known location.
5.	<b>&lt;goto&gt; ::= wait</b>	Wait at a location for someone or something.
6.	<b>&lt;goto&gt; ::= explore</b>	Just wander around and look.
7.	<b>&lt;goto&gt; ::= follow</b>	Follow somebody or something.
8.	<b>&lt;goto&gt; ::= stealth</b>	Sneak by someone.
9.	<b>&lt;goto&gt; ::= &lt;learn&gt; &lt;goto&gt;</b>	Find out where to go and go there.
10.	<b>&lt;goto&gt; ::= &lt;prepare&gt; &lt;goto&gt;</b>	Prepare before going somewhere.
11.	<b>&lt;learn&gt; ::= <math>\epsilon</math></b>	You already know it.
12.	<b>&lt;learn&gt; ::= &lt;goto&gt; &lt;subquest&gt; listen</b>	Go someplace, perform a subquest, get info from NPC.
13.	<b>&lt;learn&gt; ::= &lt;goto&gt; &lt;get&gt; read</b>	Go someplace, get something and read what is written in it.
14.	<b>&lt;learn&gt; ::= &lt;get&gt; &lt;subquest&gt; &lt;give&gt; listen</b>	Get something, perform a subquest, give to NPC in return for info.
15.	<b>&lt;learn&gt; ::= &lt;goto&gt; &lt;subquest&gt; examine</b>	Go someplace, perform a subquest, examine something.
16.	<b>&lt;prepare&gt; ::= &lt;goto&gt; &lt;subquest&gt;</b>	Go someplace and perform a subquest.
17.	<b>&lt;get&gt; ::= <math>\epsilon</math></b>	You already have it.
18.	<b>&lt;get&gt; ::= &lt;steal&gt;</b>	Steal it from somebody.
19.	<b>&lt;get&gt; ::= &lt;goto&gt; gather</b>	Go someplace and pick something up that's lying around.
20.	<b>&lt;get&gt; ::= &lt;goto&gt; take</b>	Go someplace and take something.
21.	<b>&lt;get&gt; ::= &lt;goto&gt; &lt;get&gt; &lt;subquest&gt; &lt;goto&gt; exchange</b>	Go someplace, get something, perform a subquest for somebody, return and exchange.
22.	<b>&lt;steal&gt; ::= &lt;goto&gt; stealth take</b>	Go someplace, sneak up on somebody and take something.
23.	<b>&lt;steal&gt; ::= &lt;goto&gt; &lt;defeat&gt; take</b>	Go someplace, defeat somebody and take something.
24.	<b>&lt;capture&gt; ::= &lt;goto&gt; use capture</b>	Go someplace, use something to capture somebody.
25.	<b>&lt;capture&gt; ::= &lt;goto&gt; damage capture</b>	Go someplace, damage to capture somebody.
26.	<b>&lt;capture&gt; ::= &lt;goto&gt; capture</b>	Go someplace and capture somebody.
27.	<b>&lt;defeat&gt; ::= &lt;goto&gt; damage</b>	Go someplace and damage somebody.
28.	<b>&lt;defeat&gt; ::= &lt;goto&gt; kill</b>	Go someplace and kill somebody.
29.	<b>&lt;report&gt; ::= <math>\epsilon</math></b>	There is nothing to report.
30.	<b>&lt;report&gt; ::= &lt;goto&gt; report</b>	Go someplace and report to somebody.
31.	<b>&lt;give&gt; ::= <math>\epsilon</math></b>	There is nothing to give.
32.	<b>&lt;give&gt; ::= &lt;goto&gt; give</b>	Go someplace and give something to somebody.
33.	<b>&lt;rescue&gt; ::= free</b>	Free somebody from imprisonment.
34.	<b>&lt;rescue&gt; ::= &lt;defeat&gt; free</b>	Defeat somebody and free somebody from imprisonment.
35.	<b>&lt;rescue&gt; ::= escort</b>	Escort somebody to someplace.
36.	<b>&lt;rescue&gt; ::= &lt;defeat&gt; escort</b>	Defeat somebody and escort a different somebody to someplace.

Table 2. Action rules in BNF.

#	Action	Pre-condition	Post-condition
1.	$\epsilon$	None.	None.
2.	capture	Somebody is there.	They are your prisoner.
3.	damage	Somebody or something is there.	It is more damaged.
4.	defend	Somebody or something is there.	Attempts to damage it have failed.
5.	escort	Somebody is there.	They will now accompany you.
6.	examine	<b>Somebody or something is there.</b>	<b>You have information about it.</b>
7.	exchange	Somebody is there, they and you have something.	You have theirs, they have yours.
8.	experiment	Something is there.	Perhaps you have learned what it is for.
9.	explore	None.	Wander around at random.
10.	follow	<b>Somebody or something is there.</b>	<b>You will now accompany them.</b>
11.	free	<b>Somebody is there.</b>	<b>They are no longer prisoner.</b>
12.	gather	Something is there.	You have it.
13.	give	Somebody is there, you have something.	They have it, you don't.
14.	goto	You know where to go and how to get there.	You are there.
15.	kill	Somebody is there.	They are dead.
16.	listen	Somebody is there.	You have some of their information.
17.	read	Something is there.	You have information from it.
18.	repair	Something is there.	It is fixed, built or resolved.
19.	report	Somebody is there.	They have information you have.
20.	spy	Somebody or something is there.	You have information from it.
21.	stealth	Somebody is there.	Sneak up on them.
22.	take	Somebody is there, they have something.	You have it, they don't.
23.	use	Somebody or something is there.	It has affected characters or environment.
24.	wait	<b>None.</b>	<b>Wait for something to happen.</b>

Table 3. Atomic actions.

the opportunity to learn a bit of the character's backstory and possible relationship with the main character Geralt. Actions "wait" and "free" were also added, the first rarely appearing, while the second can be seen as an alternative to simply escorting a character, after being rescued. This action appeared more often than the "escort" action in the Witcher's main story quests. A good example for the use of the action "free", is the quest "A Poet Under Pressure". Here the player has to rescue the halfling Dandelion. After following a Witch Hunter that fled from a failed ambush, the player enters the house where Dandelion is being held captive. After you defeat the Witch Hunter, the player is able to free Dandelion and report to Irina. This quest is also a good example for the addition of the action rule <defeat>. In Doran and Parberry's strategies, the "Rescue NPC" strategy (see Table 1, motivation Serenity) required the player to "damage" the captor, whilst in this quest the player is required to "kill" the captor.

### QUEST EXAMPLE

In this section we analyse the quest "The Beast of White Orchard", one of "The Witcher 3" main story quests, using the new set of rules (see Figure 6 for full quest). The quest is given out by a "Nilfgaardian" Commander with the promise of information about the witch Yennefer, which Geralt (the player) is currently looking for. The Nilfgaardian army is having trouble with a Griffin, that has been randomly attacking its soldiers, and the Commander wants Geralt to kill it. Looks simple, but this quest requires the player several preparatory steps. First the player has to find information by talking to a hunter about the griffin. Information like where its current location is or why it is on a rampage. He/she also has to gather

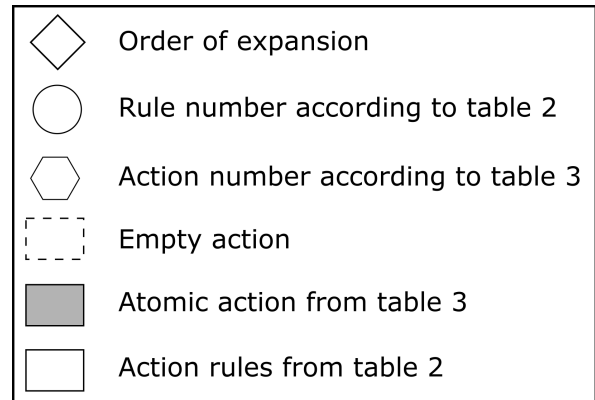

Figure 1. Key to all other Figures.

a plant with a strong scent that attracts it, by talking with a herbalist. In a way the player needs to prepare before the encounter with the griffin. This quest can be seen as having the motivation "Comfort", using the strategy "Kill Pests", which starts with the sequence of actions "<goto> <defeat> <report>" (see Figure 2, and Table 1).

The first action rule <goto>, implies that the player must go to the griffin's location. In Doran and Parberry's rules, the player would either have to learn the location, in case it was unknown, or explore. In this quest, instead, it was required to make preparations before facing the griffin, namely to learn about the griffin and gather something to lure it. So in this case we use rule number 10 (from Table 2) "<prepare>

Figure 2. Initial strategy of example quest.

Figure 3. Expansions of <goto> (rule number 11) and <prepare> (rule number 17), both newly added.

<goto>". The action <prepare> will be expanded to "<goto> <subquest>" (rule number 16)(see Figure 3).

The next <goto> (4th expanded action), requires the player to go to the site where Nilfgaardian soldiers were attacked, but first he/she has to talk to the hunter, to guide the player there. So the <goto> is expanded to "<learn> <goto>" using rule number 0. The <learn> is then expanded using rule number 12 "<goto> <subquest> listen". The player must first go to the Hunter's house to find that he isn't there, which requires the player to explore and examine clues that direct the player to the Hunter's location (see Figure 4). Here is the first instance where the use of Doran and Parberry's rules, is unable to represent the quest. It wouldn't be possible for the player to find the hunter, without the atomic action "examine" and the newly added rule number 15, which isn't represented in their set of rules.

After finally reaching the Hunter (12th expansion), the <QUEST> action rule is then expanded to Comfort motivation strategy "Kill Pests". Here the hunter asks the player to kill some wild dogs that are troubling him (13th-20th expanded actions). After reporting to the hunter the player must follow him to the site where the soldiers were attacked. Again this atomic action isn't present in the rules defined in [4]. Once at the site, the player has again to examine some clues, that lead to tracks that must be followed. Finally leading to the griffin's nest, where the player learns the final details about the griffin (21st-29th expanded actions)(see Figure 5). Notice that if we were using the set of rules defined by Doran and Parberry, these sequence of actions wouldn't be possible. Instead we would have an atomic action "goto", that would make the player go directly to the nest, alternatively to finding his/her way over there.

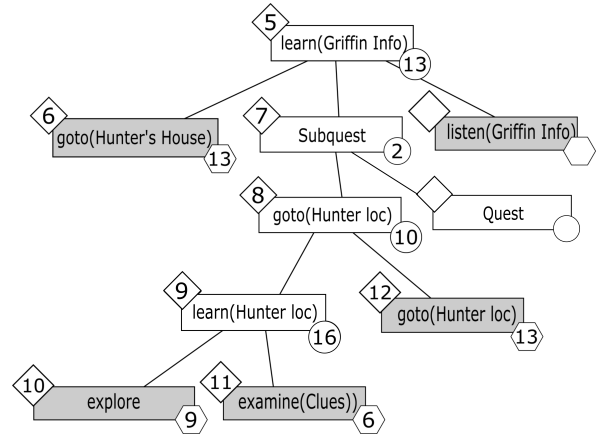

Figure 4. Expansions 5 to 12, use of newly added action "examine".

Figure 5. Expansions 22 to 29. Note expansion of <goto> after <learn> is closed and the use of newly added action "follow".

Thus closes the <goto> action rule expanded after <prepare> (3rd expanded action)(see Figure 3). Now the <subquest> is expanded using rule number 2 (from Table 2), "<goto> <QUEST>". Before facing the griffin, the player must still gather buckhorn to be used as lure. But first he/she must learn its location. The player must first talk to a herbalist to get this information. This is all represented through expanded actions 32-36 (see Figure 3). Although it wasn't given by any specific NPC, the gathering of the buckhorn is represented through the expansion of <QUEST> using the strategy "Gather Raw Materials" from motivation Wealth, which can be resumed to a simple atomic action "gather", since the player is already at the location (see Table 1).

Having gathered every bit of information and the necessary lure, it is now time to move to the griffin's location and ultimately defeat it. The <goto> from the original strategy ends with an atomic "goto" (see Figure 3), continuing with the expansion of the action rule <defeat>(see Figure 2). As stated before, the action rule <defeat> was added, so it would be possible for a generator to decide whether a strategy would have the player kill or damage an enemy. In the end, both actions can be summarized as defeating an opponent. The choice of which action to perform, could then be given either to the player or to the NPC giving out the quest. In this case, the <defeat> rule is expanded using rule 28 "<goto> kill" (see Table 2).

The next step for the player, is to use the previously gathered buckhorn to lure the griffin out. Since it isn't required to learn anything, we expand the <goto> action using rule 10, <prepare> <goto>. The <prepare> action rule is then expanded using rule 16. Now we have "<goto> <QUEST> <goto>", both <goto> are empty since the player is already where he/she needs to be, and <QUEST> is expanded using the strategy "Use existing tools" from Ability motivation, to an atomic action "use"(see Table 1 and Figure 6). Since the player isn't required to move, we are left only with the decisive action of killing the griffin (51st expanded action). Finishing with the <report> action rule, which is expanded using rule 30, "<goto> report"(see Table 2). The player most now return to the Nilfgaardian camp and report to the Commander (52nd-54th expanded action).

As can be observed, in figure 6, all required actions were successfully represented using this new set of rules. The addition of 4 new atomic actions, as well as the addition of action rules <report> and <give> to the strategies, was simply to help represent certain sequences of actions executed by the player in "The Witcher 3". The biggest difference, and probably the most influential, was the removal of the atomic actions "goto", after the <learn> and <QUEST> actions rules (see rules 2 and 9 from Table 2). These atomic "goto"s were restricting greatly the order in which actions could be performed. Their removal, allows for more variability, but we lose control over the size of the generated quest. Nonetheless, it is possible to restrict the expansion of these action rules. By means of limiting the depth of the tree, or simply by giving a probability

for expanding a rule, making some rules less or more likely in certain depths.

## CONCLUSION

In this paper we introduce adjustments to the quest structure, defined by Doran and Parberry[4], in their analysis of MMORPG quests. These adjustments were based on our study of the 58 main quests from the prize-winning single player RPG game "*The Witcher 3 - The Wild Hunt*". In their paper Doran and Parberry concluded that further work was necessary to prove the capabilities of their generator in producing quests equal in quality as human-authored ones. We believe that our adjustments to the original structure, make it more expressive. Since no tests were conducted with human players, it is impossible to determine the quality of quests based on this structure. Nonetheless, we hope that this structure gives a significant contribution in making procedurally generated quests closer to the ones written by humans. Note, however, that through our analysis we found that Witcher quests aren't completely similar to the MMORPG quests. Thus, we suggest the study of other single player RPGs to further improve this quest structure, hoping it will help close the remaining gap.

The quest structure defined in this paper is to be implemented in a game experience, currently in development. Our goal is to create a system, that uses a procedural approach to story generation. The system will simulate a story world, where a structured narrative can emerge through the interactions between NPCs and the player in the form of quests, based on the structure presented here. NPCs will be responsible for reasoning about which actions are more appropriate for achieving a goal, select them and create a quest that is motivated by their own intentions. Thus, giving a greater sense of realism. Additionally, the system will also use a learned player model to adapt the subquests to the player's preferences. We hope this system will be able to improve both the chances of re-playability and player enjoyment, by offering the player more customized content variety.
